Job Opportunity: Insect Biodiversity Data Manager

August 7, 2024

The UF Forest Entomology Lab is looking for an **Insect Diversity Data Manager**. The ideal applicant will have experience with relational and other databases, biodiversity data standards, and the science of taxonomy and systematics.

The goal of this project is to transform an existing large database of beetle systematics, images, and biogeography, into an online resource for the global systematics community and government agencies. Methods are likely to include the development of Darwin Core archives, working with the Symbiota platform, and optimization of the user interface and user experience.

We are expecting to hire at the postdoc level or similar; but more important than rank is the applicant's experience, communication skills, and orientation towards the user.

Besides working with our team, the University of Florida offers endless opportunities for growth and training for aspiring biodiversity data scientists, including the most advanced phylogenetics and data science teams and the largest computing power in the Southeastern U.S.

Details:

- Annual salary: $50,000 including full health benefits.
- Duration: This will be a one-year position with a high likelihood of continuation depending on performance. The contract will include three months of probation period.
- Position start: flexible, ideally before the end of 2024.
- In-person work is preferred. Remote work is possible, but at least occasional physical presence in Gainesville, FL, and/or Austin, TX, will be required.

To apply, send the following to ForestEntomology@ifas.ufl.edu:

- A letter describing your experience with entomology, biosystematics, or related fields.
- Your CV
- A list of your hobbies (what do you do when nobody tells you what to do?)

Application deadline: September 09, 2024.
